COE 608: Computer Architecture and Design

COE 608: Lab 4, Part 2 Report

Objective

The purpose of this lab is to put together everything we have done so far, with the addition of the upper zero extender, lower zero extender, and reducer with the program counter, arithmetic logical unit, multiplexers, and operational inverters into a functioning data-path for the MIPS instructional set architecture.

Design and Implementation

I first started with the reducers, LZE and UZE implementations. I did the data-path last. The following truth-tables provide examples of some of the purposes of the LZE, UZE, and reducer. The LZE extends zeroes by padding the bits from 15 down to 0. The UZE does the inverse of the LZE operation by padding zeroes from 31 down to 16. The reducer helps to reduce a 32-bit data into 8-bit data. The data-path is programmed in VHDL using the structural behavior, by utilizing port mapping and signals to denote the wires and buses between the many devices used throughout the course.

The truth tables for each of the new devices are illustrated in the following pages.

See the following figures below: Figure 1: UZE Truth Table, Figure 2: LZE Truth Table, Figure 3: Reducer Truth Table and Figure 4: Data-path signals truth table.

Upper Zero Extender	
In (hex)	**Out (hex)**
00000001	00000000
0000000A	00000000
000F9EDF	000F0000
ABC85FG1	ABC80000

Figure 1: UZE Truth Table

Next, is the Lower Zero Extender Truth Table:

Lower Zero Extender	
In (hex)	**Out (hex)**
00000001	000000001
0000000A	000000000A
000F9EDF	000009EDF
ABC85FG1	000005FG1

Figure 2: LZE Truth Table

Next, is the Reducer Truth Table:

Reducer	
In (hex)	**Out (hex)**
00000001	01
0000000A	0A
000F9EDF	9EDF
ABC85FG1	5FG1

Figure 3: Reducer Truth Table

Finally, the Data-path Truth Table:

Observations and Results

Below are the functional and timing waveforms derived for each of the new components listed for this lab.

The following figures are the observations of this project:

Figure 5: LZE Functional Waveform, Figure 6: LZE Timing Waveform, Figure 7: UZE Functional Waveform, Figure 8: UZE Timing Waveform, Figure 9:Reducer Functional Waveform, Figure 10: Reducer Timing Waveform, Figure 11: Data-path Random Input Waveform, Figure 12: Data-path Output Functional Waveform, and Figure 13: Data-path Output Timing Waveform are the figures of interest.

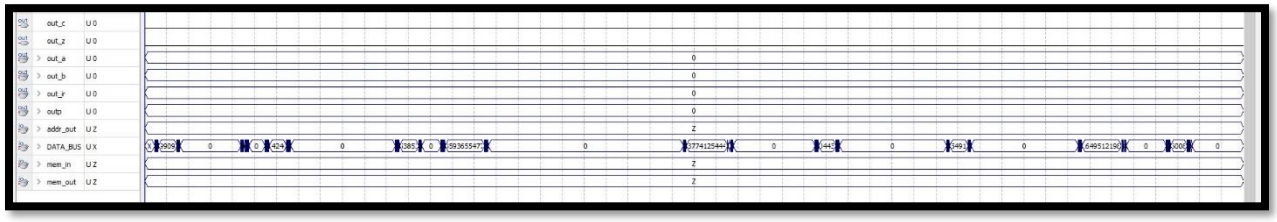

Figure 13: Data-path Output Timing Waveform

Discussions and Conclusions

The data-path implements INCA, ADDI, LDBI and LDA operations by using a finite state machine to select these advanced operations.

The main determinant of the data-path speed is the longest operation performed. In this case, the worst-case timing depends on the operation that is most time-consuming. From Figure 13, it appears the worst-case delay is 10 ns.

The most reliable limit for the data-path clock is 10 ns.

Appendix: VHDL Codes and Screenshots of Waveforms

I have provided the VHDLD and screenshots of the waveforms for easier reading.
